trade bibliography. The nature and diversity of presentations at the second International Conference on Insect Neurochemistry and Neurophysiology (ICINN--86) held at the University of Maryland on August 4-6, 1986, attest to the vitality and broad scope of research in insect neuroscience. The present volume is a written account of the invited lectures, contributed papers, and posters presented at the conference, and as such, serves as a fair indicator of the trends in current research in this field here and abroad. The principal portion of this book consists of seven review papers that were presented by invited speakers. Although the topics vary widely, they reflect on and emphasize the main theme of the conference, i. e. , the nature and function of molecular messengers that communicate between the central nervous system and organs or tissues involved in the growth, development, reproduction, and behavior of insects. This emphasis is continued in the following three sections on neurochemistry, neurophysiology, and neuroanatomy, although no conscious effort was made by the organizers to highlight these particular fields of neuroscience. It is evident that the recent advances in both physical and chemical analytical techniques have made possible the acquisition of structurally defined probes, the long sought-after tools for unraveling the secrets of endogenous communication. Each section of short papers derived from the oral and poster presentations at the conference is prefaced by an overview that highlights and summarizes the section's content. Proceedings from the September 1988 meeting. The major emphasis is on new polymeric materials, and papers are grouped into sections on various applications: ophthalmic; surgical, dental, and diagnostic; and controlled release and bioactive polymer applications.
